Fig. 2-5 Package Dimension

## Notes:

- 1) Controlling dimension: millimeter
- 2) Primary datum C and seating plane are defined by the spherical crowns of the solder balls.
- Timaly data in C and seating plane are defined by the spherical crowns of the solder balls.
   Dimension b is measured at the maximum solder ball diameter, parallel to primary datum C.
   Special characteristics C class: A, ddd
   The pattern of pin 1 fiducial is for reference only.
   The tilt of heat sink should be within 10mil(0.254mm) (vertical position)

## 2.7 Power supply for IO

- PMUIO1 IO domain
  - Only support 1.8v mode, with PMUIO1\_VDD\_1V8(1.8v typical) power supply.
- PMUIO2 IO domain
  - Support 1.8v and 3.0v mode, controlled by PMUGRF\_SOC\_CON0[9:8], please refer to GRF TRM chapter for detail control information description.
  - With PMUIO2\_VDDPST and PMUIO2\_VDD two power supply.
    - ◆ 1.8v mode: Both PMUIO2\_VDDPST and PMUIO2\_VDD power supply with 1.8v(typical).
    - ◆ 3.0v mode: PMUIO2\_VDDPST power supply with 1.8v(typical) and PMUIO2\_VDD power supply with 3.0v(typical).
  - PMUIO2\_VDDPST and PMUIO2\_VDD power up rise time need to >100us and power down fall time also need to >100us.

- Change from 3.0v mode to 1.8v mode sequence: change external power supply firstly, then wait >1ms, last configure GFR register to change IO working mode.
- Change from 1.8v mode to 3.0v mode sequence: configure GFR register to change IO working mode firstly, then wait >1ms, last change external power supply.
- Power up sequence for 3.0v mode: power up PMUIO2\_VDDPST firstly, then wait >20us, last power up PMUIO2\_VDD.
- Power down sequence for 3.0v mode: power down PMUIO2\_VDD firstly, then wait >20us, last power down PMUIO2\_VDDPST.
- Not support fail-safe condition (PMUIO2 power off, but signal PAD still with high level input drive), otherwise IO reliability will be uncontrollable.

#### APIO1 IO domain

- Only support 3.3v mode, with APIO1\_VDDPST(1.8v typical) and APIO1\_VDD(3.3v typical) two power supply.
- APIO1\_VDDPST and APIO1\_VDD power up rise time need to >100us and power down fall time also need to >100us.
- Power up sequence: power up APIO1\_VDDPST firstly, then wait >20us, last power up APIO1\_VDD.
- Power down sequence: power down APIO1\_VDD firstly, then wait >20us, last power down APIO1 VDDPST.
- Not support fail-safe condition (APIO1 power off, but signal PAD still with high level input drive), otherwise IO reliability will be <u>uncontrollable</u>.

#### APIO2/4/5 IO domain

- Support 1.8v and 3.0v mode, controlled by GRF\_IO\_VSEL, please refer to GRF TRM chapter for detail control information description.
- With APIO2/4/5 VDDPST and APIO2/4/5 VDD two power supply.
  - ◆ 1.8v mode: Both APIO2/4/5\_VDDPST and APIO2/4/5\_VDD power supply with 1.8v(typical).
  - ◆ 3.0v mode: APIO2/4/5\_VDDPST power supply with 1.8v(typical) and APIO2/4/5\_VDD power supply with 3.0v(typical).
- APIO2/4/5\_VDDPST and APIO2/4/5\_VDD power up rise time need to >100us and power down fall time also need to >100us.
- Change from 3.0v mode to 1.8v mode sequence: change external power supply firstly, then wait >1ms, last configure GFR register to change IO working mode.
- Change from 1.8v mode to 3.0v mode sequence: configure GFR register to change IO working mode firstly, then wait >1ms, last change external power supply.
- Power up sequence for 3.0v mode: power up APIO2/4/5\_VDDPST firstly, then wait >20us, last power up APIO2/4/5\_VDD.
- Power down sequence for 3.0v mode: power down APIO2/4/5\_VDD firstly, then wait >20us, last power down APIO2/4/5\_VDDPST.
- Not support fail-safe condition (APIO2/4/5 power off, but signal PAD still with high level input drive), otherwise IO reliability will be <u>uncontrollable</u>.

- APIO3 IO domain
  - Only support 1.8v mode, with APIO3\_VDD\_1V8(1.8v typical) power supply.
- SDMMC IO domain
  - Support 1.8v and 3.0v mode, controlled by GRF\_IO\_VSEL, please refer to GRF TRM chapter for detail control information description.
  - With only SDMMC0\_VDD one power supply.
    - ◆ 1.8v mode: SDMMC0 VDD power supply with 1.8v(typical).
    - ◆ 3.0v mode: SDMMC0\_VDD power supply with 3.0v(typical).
  - SDMMC0\_VDD power up rise time need to >100us and power down fall time also need to >100us.
  - Change from 3.0v mode to 1.8v mode sequence: change external power supply firstly, then wait >1ms, last configure GRF register to change IO working mode.
  - Change from 1.8v mode to 3.0v mode sequence: configure GFR register to change IO working mode firstly, then wait >1ms, last change external power supply.
  - Not support fail-safe condition (SDMMC power off, but signal PAD still with high level input drive), otherwise IO reliability will be <u>uncontrollable</u>.

#### Notes:

①:Pad types : I = input , O = output , I/O = input/output (bidirectional) ,  $AP = Analog \ Power$  ,  $AG = Analog \ Ground$   $DP = Digital \ Power$  ,  $DG = Digital \ Ground$  A = Analog

- ②: Output Drive strength is configurable, it's the suggested value in this table. Unit is mA , only Digital IO have drive value
- 3:Reset state: I = input without any pull resistor <math>O = output
- @:It is die location. For examples, "Left side" means that all the related IOs are always in left side of die
- ⑤:Power supply means that all the related IOs are in this IO power domain. If multiple powers are included, they are connected together in one IO power ring
- ©:The pull up/pull down is configurable.

## **Chapter 4 Thermal Management**

#### 4.1 Overview

For reliability and operability concerns, the absolute maximum junction temperature has to be below 125°C.

### 4.2 Package Thermal Characteristics

Table 4-1 provides the thermal resistance characteristics for the package. The resulting simulation data for reference only, please prevail in kindtest.

Table 4-1 Thermal Resistance Characteristics

Parameter	Symbol	Typical	Unit	
Power Dissipation		6.05	W	
Junction-to-ambient thermal resistance	$ heta_{JA}$	12.39	(°C/W)	
Junction-to-board thermal resistance	$\theta_{JB}$	7.7	(°C/W)	
Junction-to-case thermal resistance	$\theta_{JC}$	0.38	(°C/W)	

Note: The testing JEDEC PCB is based on 6 layers, 114.3x101.6 mm, 1.6 mm Thickness, ambient temperature is 25  $^{\circ}$ C.
